1. **Bookmarks** save a specific report state. They improve storytelling by creating interactive views and improve UX by making navigation easier.
2. **Slicers/filters** filter data on the current page. **Drill-through** opens a detailed page for selected data. Drill-through is more powerful when users need detailed information about a specific customer, product, or region.
3. **Buttons** provide navigation and interactive actions.
    - **Dashboard → Details:** quickly open detailed analysis.
    - **Show/Hide Filters:** easily open or close the filter panel.
4. **Page navigation** allows users to move between report pages. It is important for creating multi-page dashboards that work like applications.
5. **Static navigation** uses standard page tabs, while **interactive navigation** uses buttons and bookmarks. Interactive navigation provides better storytelling because it gives more control over the user journey.
6. **Bookmarks + Buttons + Drill-through** provide interactive navigation, saved views, and detailed analysis. Together, they can transform a normal report into an **application-like dashboard**.
