1. Visual Calculations

Visual Calculations are calculations created directly inside a visual. Unlike regular DAX measures, they are mainly used for a specific visual and are not generally reusable across the whole model.

2. Calculation Groups

Calculation Groups allow the same calculation logic to be applied to multiple measures. They reduce repeated DAX code and make enterprise data models easier to maintain.

3. Custom Visuals

Custom Visuals are additional visuals that extend Power BI's built-in visualizations. They are useful when standard charts like bar or line charts cannot effectively represent the required data.

4. DAX Optimization

DAX Optimization means improving DAX and the data model for better performance.

Techniques:

- Use measures instead of unnecessary calculated columns.
- Avoid unnecessary `FILTER()` and iterator functions.
- Remove unused columns and rows.
- Use `VAR` for repeated calculations.
- Use a proper star schema.
